

## ***Interactive comment on “Nanofiltration for water and wastewater treatment – a mini review” by H. K. Shon et al.***

**Anonymous Referee #2**

Received and published: 24 April 2013

This brief review discussed the application of membrane technology in water and wastewater treatment. They mainly focused on the application of NF for water and wastewater treatment including fundamentals of membrane process and mechanisms of NF process including few basic models. I believe that the discussions presented in this review can definitely contribute to the understanding of the NF processes. This review is well organized and clearly written but some mistakes including typographical errors are also founded in the text. Hence, I would recommend this manuscript for publication in Drinking Water Engineering and Science Discussions after some technical corrections.

Abstract Page 60, line 8 fouling challenges and their control mechanisms adopted. → Please revise the above sentence.

C14

Introduction With technological advances and the ever-increasing stringency of water quality criteria, membrane processes are becoming a more attractive solution to the challenge of quality water, and water reuse (Shannon et al., 2008). The use of membrane technology in wastewater reclamation is increasing as the requirement of stringent water quality is being felt by the pollution control authorities around the world. → Please revise the above sentences. In my view, those sentences have the same meaning in a sense.
