10 **ABSTRACT:**

11 In this paper, the heavy metals of the surface drinking water of Damietta
12 governorate were evaluated. Damietta district, Farascore City, EL-Zarka City and Kafr
13 Saad City are the main locations of drinking water pollution. The villages of the Damietta
14 governorate have concentration values less than the permissible limits of World Health
15 Organization (WHO) and Egyptian Ministry Health (EMH). The pollution in the villages
16 water by heavy metals less than that in the cities.

17
18 **Keywords:** Water – pollution – Drinking – Damietta - Toxic
19

20 **INTRUDUTION:**

21
22 Environmental problems such as water and air pollution have been occurred due
23 to the agricultural and industrial development, where this pollution affect on the human
24 health (Wang et al. 2010;Patrick 2003). The heavy metals entering the biosphere due to
25 the industrialization and urbanization projects (Nweke 2009;Gazso 2001). About 80% of
26 the illness is accompanied with water pollution in developing countries, where more than
27 14,000 death cases daily (Pink and Daniel 2006; West 2006).

28 Uses of water for drinking, agriculture and industry purposes impair due to
29 anthropogenic and natural processes that degrade the water (Sanchez et al. 2007).
30 Chronic diseases (Liver Cirrhosis, Rental Failure, Chronic Anemia and Hair Loss) occur
31 due to the pollution of drinking water by heavy metals such as Cu, Cd, Ni, Cr and Pb
32 (Wang et al, 2010, Salem et al., 2000). Renal failure is occur when the drinking water
33 polluted with Cd and Pb; liver cirrhosis to the pollution with Cu and molybdenum; hair
34 loss to the pollution with Cr and Ni; and chronic anemia to the pollution with Cd and Cu
35 (Johri et al., 2010).

36 Most of Damietta governorate lands with agricultural activities. Where, use the
37 pesticides and fertilizers increase the pollution in water and plants. Thus the human
38 health in dangerous in Damietta Governorate especially after the construction of the
39 industrial area, Damietta Harbor, reclamation projects and agricultural development.

40 The drinking water resources in the Damietta governorate comprise both Damietta
41 Nile branch surface and ground waters. Water pollution is the main environmental
42 problem in Damietta Governorate and in whole Arab Republic of Egypt. Pollution
43 sources of Damietta Nile Branches water come from agricultural drains, domestic
44 sewage, industrial effluents and fish farms (Abdel Wahaab and Badawy 2004).

SAMPLING AND METHODS:

Drinking water samples were collected from different districts of Damietta governorate; Damietta, New Damietta City, Ras El-Bar, Kfr Saad, Farascour and EL-Zarka (Fig. 1). These samples collected from surface network water in each district, where the samples taken from public site in district. The samples randomly collected from each site in district. Heavy metals concentrations of drinking surface network water were analyzed by atomic absorption spectrophotometer (AAS) (Table 1). These metals are lead (Pb), zinc (Zn), copper (Cu), cobalt (Co), cadmium (Cd), nickel (Ni), chromium (Cr), iron (Fe) and manganese (Mn). The estimated values compared with WHO, 2011 and EMH, 2007 values to evaluate the studied drinking water. Where, this instrument available in the National Research Center for such studies.

Calculation of Pollution Index:

The pollution index (PI) was used in this study to evaluate the degree of heavy metal contamination in water samples (Chon, et al., 1991; Kim et al., 1998; Emoyan et al., 2005; Odukoya and Abimbola 2010). The tolerable level is the element concentration in the water considered safe for human consumption (Lee et al., 1998). Pollution index

73 (PI) is based on individual metal calculations and categorized into 6 classes (Table 2)
 74 according the following equation (Caerio et al., 2005).

$$PI = \sum_{i=1}^n \frac{\left(\frac{C_i}{S_i}\right)}{Nm}$$

75
 76 Where C_i = Heavy metal concentration in water; S_i = permissible Level and N_m = Number
 77 of Heavy metals.

78 Water sample with Pollution Index (PI) greater than 1 is regarded as being contaminated

Class	PI value	Class
1	<1	No effect
2	1–2	Slightly affected
3	2–3	Moderately affected
4	3–5	Strongly affected

5	>5	Seriously affected
---	----	--------------------

RESULTS AND DISCUSSION

The results are shown in Table 1 and 3. Where, the concentration of heavy metals in the drinking water and the pollution index of each site recorded in these tables. The values in Table 1 were compared with the permissible limits of Egyptian Ministry Health (EMH) permissible limits, 2007 and the permissible limits of WHO, 2011. As well as the pollution index were determined for each site or sample.

The drinking surface network water in Ras EL-Bar and New Damietta cities is suitable for drinking due to the whole values of heavy metals less than the permissible limits of EMH, 2007 and WHO, 2011 (Table. 1). Pollution index (PI) of these districts or cities in Damietta governorate showed that the degree of heavy metals contamination is no effect (<1) (Table. 2 and 3).

In Damietta district, Cd values of the samples are more than the permissible limits of EMH, 2007 and WHO, 2011. Cu values of the samples less than the permissible limits of EMH, 2007 and WHO, 2011 except in samples 9 and 12. Ni, Cr, Pb values are \geq the permissible limits of EMH, 2007 and WHO, 2011. Co, Mn and Fe values are less than the permissible limits of EMH, 2007 and WHO, 2011. Pollution index of Damietta district is moderately affected category (2-3) (Table 2 and 3).

In Farascore district, the concentration values of heavy metals in Farascore city more than that in the villages of Farascore. Samples of Farascore city (14,15 and 16) showed that Cd, Ni, Cr and Pb values more than the permissible limits of EMH and WHO. The Cu, Co, Mn, Fe and Zn are less than the permissible limits of EMH and WHO. Samples of the villages of Farascore have values less than the permissible limits of EMH and WHO. Pollution index of the Farascore district showed slightly affected grad in samples 14, 15 and 16, while it is no affected grad in the other samples.

In EL-Zarka district, samples 25, 26 and 27 of Zarka city show that Cd Ni, Cr and Pb values more than the permissible limits of EMH, 2007 and WHO,2011. The Cu, Co, Mn, Fe and Zn are less than the permissible limits cof EMH and WHO. Samples of the villages of EL-Zarka have values less than the permissible limits of EMH and WHO. Pollution index of EL-Zarka district showed slightly affected grad in samples 25, 26 and 27, while it is no affected grad in the other samples.

In Kaf Saad district, the sample 30 and 31 of Kafr Saad city showed that Cd, Ni, Cr and Pb values more than the permissible limits of EMH, 2007 and WHO,2011, while the other metals are less than the permissible limits. Samples of the villages of Kafr Saad have concentration values less than the permissible limits of EMH, 2007 and WHO,2011. Pollution index of Kafr Saad district showed slightly affected grad in samples 30 and 31, while it is no affected grad in the other samples.

Thus the populations of Damietta City, Farascore City, EL-Zarka City and Kafr Saad City may be suffering from many diseases such as Liver Cirrhosis, Rental Failure, Chronic Anemia and Hair Loss.

CONCLUSIONS

140 pollution of surface drinking water of Damietta governorate by heavy metals in
 141 most of villages less than that in the cities of the Damietta governorate. Pollution index is
 142 ranged between no affected to moderately affected for whole station samples.
