

Interactive comment on “Modelling the potable water quality in a distribution network based on the hydraulic conditions” by Jani Tomperi

Anonymous Referee #2

Received and published: 11 September 2020

In the manuscript the idea of a data-based turbidity model is presented. However, no actual data and results, apart from a single table with statistical parameters, are included in the manuscript. Methodology section is not written in a clear way, and therefore needs to be improved. In addition to this, less general comments should be made and specific comparisons with literature should be performed in the discussion section. Overall: Even though the idea of the paper is interesting, the author needs to rewrite the paper in order to meet the DWES Journal standard
